

# What is the usual number of turbines in a wind farm?

Around **80%** of total projects have 50 or less turbines.  
However, there are also 4 projects with **150 or more** turbines, of which 3 are in **Quebec**.

# How does the wind farm capacity vary with the number of turbines?

As expected there exists a strong positive correlation between project capacity and number of turbines. The **Box Springs Wind Project** in Alberta seems to defy this trend but this seems more like a data error.
